

# Keeper

## Project Description:

- Keeper is a note-taking application similar to Google Keep built as part of learning the power of Frontend technology.
- It maintains Title and Content field separately.
- It has Add and Delete card functionality.
- This project is developed as part of learning, understanding and implementing Full Stack Development technology.
- Tech used: HTML 5, CSS 3, JavaScript ES6, React, Node JS

## Learnings:

- One of the main benefits of using React JS is its potential to reuse components. It saves time for developers as we don't have to write various codes for the same features.
- Furthermore, if any changes are made in any particular part, it will not affect other parts of the application.
- React comes with JSX, an optional syntax extension, which makes it possible to write your own components.
- React allows building high-quality, rich user interfaces through its declarative components.
